The battery life references presented above are estimations based upon stationary life cycle testing conducted at Crown Battery Manufacturing’s Test Center in Fremont, Ohio, USA. The data references are nominal and should not be construed as maximum or minimum values for specifications or for final design. Data for this product type may vary from that shown herein, and Crown Battery makes no warranties – expressed or implied – based upon the data shown above.

**APPLICATION RECOMMENDATIONS:**

- **Specific Gravity:**
  - Full charge battery specific gravity (100% state-of-charge) is 1.275
  - Full discharge battery specific gravity (100% depth-of-discharge) is 1.125

- **Operating Temperature Range:**
  - -40°F to 120°F (-40°C to 49°C)
  - **Application Note:** Maintain a state of charge greater than 60 percent when operating flooded lead acid batteries at temperatures below 32°F (0°C).

- **Self Discharge:**
  - Fully charged batteries that are stored at a temperature of 80°F (27°C) will self-discharge at a rate of 3.5% per week.

- **Terminal Torque Specifications:**
  - **SAE / Automotive Terminal Style:**
    - 50 to 70 in-lbs / 6 to 8 Nm
  - **Stainless Threaded Terminal:**
    - 100 to 120 in-lbs / 11 to 14 Nm

- **Application Note:** Lead acid batteries contain corrosive battery electrolyte and generate highly flammable hydrogen gas. When working near batteries or battery electrolyte wear personal protective equipment and always work in a well-ventilated area. Do not over-torque terminals. Over-torque can result in terminal damage, breakage, terminal meltdown or fire.

6CRP290 Renewable Power Battery

RENEWABLE POWER BATTERY CHARGING:  
Best Practices & System Setup Recommendations

Proper charging of renewable power batteries is essential to optimize the performance and life of the batteries. To ensure dependability and life batteries should be fully charged after each discharge period. Regular monitoring of individual battery voltage and specific gravity conditions are recommended to verify system recharging performance. Many RE charge controllers have adjustable equalization settings that ensure batteries are regularly restored to full capacity. Batteries used in RE systems should be equalized every thirty days – with more frequent equalization occurring for battery systems that are regularly discharged below 50% of the battery’s rated capacity. Refer to the following table for additional charge control setting information:

<table>
<thead>
<tr>
<th>Voltage Setting</th>
<th>VPC</th>
<th>System Voltage</th>

**CHARGING FORMULAS & CALCULATIONS**  
Exclusively from Crown Battery

**GENERAL CALCULATION FOR DETERMINING DURATION OF DAILY CHARGE** (Charge Absorption)

Generalized Charge Absorption Time Calculation:

Time (hours) = 0.46 x (C ÷ I) x CF

Where:  
C = 20 Hr Battery Capacity Rating
I = Charging Current

- For 25% D.O.D. - use 0.45 for CF
- For 50% D.O.D. - use 0.70 for CF
- For 80% D.O.D. - use 1.10 for CF

Example of How to Calculate Charge Absorption Time:

When the RE Batteries are rated at:  
48 Volt Bank of Crown 6CRP290 Batteries (48 Volts, 225 Ah @ 20 Hour Rate)

When the RE System is rated at:  
RE System Rated at 1,900 Watts

When the RE System D.O.D. is set to:  
System D.O.D. Set to 50% (CF) = 0.70

Nominal Charge Current:  
Ohm’s Law: Amperes = Watts ÷ Volts

39.6 Amperes = 1900 Watts ÷ 48 Volts
39.6 Amperes Charge Current

Charge Absorption Time Calculation:  
0.46 x (225 Ah / 39.6) x 0.70 = 1.83 Hours

Charge Absorption Time:  
Time (hours) = 1.83 Hours

---

Effect of Battery Temperature on Battery Life:  
Typical battery life is based upon a baseline operating temperature of 80°F / 27°C. Temperature increases of 15°F / 10°C over the baseline will cause the battery’s rate of internal chemical reactions to double – something that will reduce battery life due to the accelerated deterioration of internal components. Please contact Crown Battery to discuss any minimal requirements for battery life when operating batteries in temperatures greater than 80°F / 27°C.
